

The Architecture of Memory

By Emily Watson (ID: FA23-014)

Memory is not a static recording device; rather, it is an active architectural endeavor that continuously reconstructs our past. In literature, Virginia Woolf and Marcel Proust demonstrated how sensory triggers unlock involuntary recollections. Through an examination of modern cognitive science alongside modernist prose, we discover that our identities are woven from shifting narrative threads.

Furthermore, collective memory shapes societal values and historical accountability. When communities preserve oral histories, they safeguard cultural resilience against systemic erasure. In conclusion, recognizing the fluidity of memory allows us to approach both literature and human experience with humility and critical awareness.
